

## Merging

Step 1: Start

Step 2: Declare the variables

Step 3: Read the size of first array.

Step 4: Read elements of first array in sorted order

Step 5: Read the size of second array.

Step 6: Read the elements of second array in sorted order.

Step 7: Repeat step 8 and 9 while  $i < m$  and  $j < n$

Step 8: check if  $a[i] \geq b[j]$  then  $c[k++] = b[j++]$

Step 9: else  $c[k++] = a[i++]$

Step 10: Repeat step 11 while  $i < m$

Step 11:  $c[k++] = a[i++]$

Step 12: Repeat step 13 while  $j < n$

Step 13:  $c[k++] = b[j++]$

Step 14: Print the first array.

Step 15: Print the second array

Step 16: Print the merged array.

Step 17: Stop.

## Stack Operations

step 1 : start

step 2 : Declare the node and the required variables.

step 3 : Declare the function for push, pop, display and search

step 4 : Read the choice from user.

step 5 : If the user chose to push an element

then read the element to be pushed and call the function to push element by passing value to the function

step 5.1 - Declare the newnode & allocate memory for the newnode.

step 5.2 : set newNode  $\rightarrow$  data = value

step 5.3 : check if top = null then set newNode  $\rightarrow$  next = null

step 5.4 : set newNode  $\rightarrow$  next = top

step 5.5 : set top = newNode & then print insertion is successful.

step 6 : If user chose to pop an element from the stack then call the function to pop the element.

step 6.1 : check if top == Null then print stack is empty

step 6.2 : Else declare a pointer variable temp and initialise it to top.

step 6.3 : Point the element that being deleted.

step 6.4 : Set temp = temp → next

step 6.5 : free the temp

step 7 : If the user choose the display then call the function to display the element in stack

step 7.1 : check if top == Null then print stack is empty.

step 7.2 : else declare the pointer variable temp and initialise it to top

step 7.3 : Repeat steps below while temp → next != null

step 7.4 : Print temp → data

step 7.5 : Set temp = temp → next.

step 8 : If the user chose to search an element from the stack then call the function to search an element.

step 8.1 : Declare a pointer variable ptr and other necessary variables.

step 8.2 : initialise ptr = top

step 8.3 : Check if ptr = null then print stack is empty

step 8.4 : else read the element to be searched

step 8.5 : Read step 8.6 to 8.8 while ptr != Null

step 8.6 : check if ptr → data == item then print element founded and to be located and set flag = 1

Step 8.7 : else set flag = 0

Step 8.8 : Increment  $i$  by 1 and set  $ptr = ptr \rightarrow next$

Step 8.9 : Check if  $flag = 0$ , then print the element  
Not found

Step 9 : stop.

## Circular Queue Operations

Step 1 : Start

Step 2 : Declare the que and other variables

Step 3 : Declare the function for enqueue, dequeue, search and display.

Step 4 : Read the choice from the user

Step 5 : If the user choose the choice enqueue, then read the element to be inserted from the user and call the enqueue function by passing the value

Step 5.1 : Check if  $\text{front} == -1$  &  $\text{rear} == -1$  then set  $\text{front} = 0$ ,  $\text{rear} = 0$  and set  $\text{queue}[\text{rear}] = \text{element}$ .

Step 5.2 : Else if  $\text{rear} + 1 \% \text{max} == \text{front}$  or  $\text{front} = \text{rear} + 1$  then print Queue is overflow

Step 5.3 : Else set  $\text{rear} = \text{rear} + 1 \% \text{max}$  and set  $\text{queue}[\text{rear}] = \text{element}$ .

Step 6 : If the user choice is the option dequeue then call function dequeue

Step 6.1 check if  $\text{front} == -1$  and  $\text{rear} == -1$  then print queue is underflow.

step 6.2: Else check if  $\text{front} == \text{rear}$  then print the element is to be deleted then set  $\text{front} = -1$  and  $\text{rear} = -1$

step 6.3: Else print the element to be dequeued set  $\text{front} = \text{front} + 1 \% \text{max}$

step 7: If the user choice is to display the queue then call the function display.

step 7.1 check if  $\text{front} = -1$  and  $\text{rear} = -1$ , then print queue is empty.

step 7.2: Else repeat the step 7.3 while  $i \leq \text{rear}$

step 7.3: print  $\text{queue}[i]$  and set  $i = i + 1 \% \text{max}$

step 8: If the user choose the search then call the function to search an element in the queue.

step 8.1: Read the element to be searched in the queue.

step 8.2: check if  $\text{item} == \text{queue}[i]$  then print item found and its position and increment  $i$  by 1

step 8-3: check if  $c=0$  then print item not found

step 9: END.

## Doubly Linked List Operation

Step 1: Start

Step 2: Declare a structure and related variables.

Step 3: Declare function to create a node, insert a node in the beginning, at end and given position, display the list and search an element in the list.

Step 4: Define function to create a node declare the required variables.

Step 4.1: ~~Define~~ function to ~~create a~~ node,  
Set memory allocated to node = kmp  
then set temp → prev = null and kmp → next = null

Step 4.2: Read the values to be inserted to the node

Step 4.3: Set temp → n = data and increment count by 1

Step 5: Read the choice from user to perform different operation on the list.

Step 6: If the user choose to perform insertion operation at the beginning then call the function to perform insertion

Step 6.1: check if head == null then call the function to create a node, perform 4 to 4.3

step 6.2: set head = temp and temp1 = head

step 6.3: Else call the function to create a node.

perform step 4 to 4.3 then set temp → next = head

set head → prev = temp and head = temp

step 7: If the user choice is to perform insertion at the end of list, then call the function to perform the insertion at the end.

step 7.1: check if head == null then call the function to create a new node then set temp = head and set head = temp1

step 7.2: Else call the function to create a new node then set temp1 → next = temp, temp → prev = temp1 and temp1 = temp.

step 8: If the user choose to perform insertion in the list at any position then call the function to perform the insertion operation

step 8.1: Declare the necessary variables.

step 8.2: Read the position where the node need to be inserted, and set temp2 = head.

step 8.3: check if pos < 1 or pos > count + 1, then print position is out of range.

step 8.4: Check if  $\text{head} == \text{null}$  and  $\text{pos} = 1$  then print "empty list can't insert other than 1st position".

step 8.5: check if  $\text{head} == \text{null}$  and  $\text{pos} = 1$  then call the function to create newNode, then set  $\text{tmp} = \text{head}$  and  $\text{head} = \text{tmp}$ .

step 8.6: while  $i < \text{pos}$  then set  $\text{tmp} = \text{tmp} \rightarrow \text{next}$  then increment  $i$  by 1.

step 8.7: call the function to create a newNode and then set  $\text{tmp} \rightarrow \text{prev} = \text{tmp}$ ,  $\text{tmp} \rightarrow \text{next} = \text{tmp} \rightarrow \text{next} \rightarrow \text{prev} = \text{tmp}$ .  
 $\text{tmp} \rightarrow \text{next} = \text{tmp}$ .

step 9: If the user choose to perform deletion operation is the list then call the function to perform the deletion operation.

step 9.1: Declare the necessary variables.

step 9.2: Read the position where node need to be deleted set  $\text{tmp} = \text{head}$ .

step 9.3: check if  $\text{pos} < 1$  or  $\text{pos} > \text{count} + 1$ , then print position out of range.

step 9.4: check if  $\text{head} == \text{null}$  then print list is empty

step 9.5 : while  $i < pos$  then  $tmp2 = tmp2 \rightarrow next$  and increment  $i$  by 1

step 9.6 : check if  $i == 1$  then check if  $tmp2 \rightarrow next == null$  then print node deleted free ( $tmp2$ ). set  $tmp2 = head = null$

step 9.7 : check if  $tmp2 \rightarrow next == null$  then  $tmp2 \rightarrow prev \rightarrow next = null$  then free ( $tmp2$ ) then print node deleted.

step 9.8 :  $tmp2 \rightarrow next \rightarrow prev = tmp2 \rightarrow prev$  then check if  $i != 1$  then  $tmp2 \rightarrow prev \rightarrow next = tmp2 \rightarrow next$ .

step 9.9 : check if  $i = 1$  then  $head = tmp2 \rightarrow next$ , then print node deleted then free  $tmp2$  and decrement count by 1.

step 10 : If the user choose to perform the display operation then call the function to display the list.

step 10.1 : set  $tmp2 = n$ .

step 10.2 : check if  $tmp2 = null$  then print list is empty.

step 10.3 : while  $tmp2 \rightarrow next != null$  then print  $tmp2 \rightarrow n$  then  $tmp2 = tmp2 \rightarrow next$ .

Step 11: If the user chose to perform the search operation then call the function to perform search operation.

Step 11.1: Declare the necessary variables.

Step 11.2: Set  $\text{tmp2} = \text{head}$ .

Step 11.3: Check if  $\text{tmp2} == \text{null}$  then print the list is empty.

Step 11.4: Read the values to be searched.

Step 11.5: While  $\text{tmp2} \neq \text{null}$  then check if  $\text{tmp2} \rightarrow \text{data} == \text{data}$  then print element found at position  $\text{count} + 1$

Step 11.6: Else set  $\text{tmp2} = \text{tmp2} \rightarrow \text{next}$  and increment count by 1

Step 11.7: Print element not found in the list.

Step 12: End.

## SET Operation

step 1 : start

step 2 : Declare the necessary variables.

step 3 : Read the choice from the user to perform set operations.

step 4 : If user chose to perform union

step 4.1 : Read cardinality of two sets.

step 4.2 : check if  $m \neq n$  then print "operation Not possible".

step 4.3 : Else read the elements in both the set.

step 4.4 : Repeat step 4.5 to 4.7 until  $i < m$

step 4.5 :  $c[i] = A[i] \cup B[i]$

step 4.6 : print  $c[i]$

step 4.7 : increment  $i$  by 1

step 5 : Read the choice from user to perform intersection

step 5.1 : Read cardinality of 2 sets

step 5.2 : check if  $m \neq n$  then print operation not possible

step 5.3 : Else read the elements in both sets

step 5.4 : Repeat the step 5.5 to 5.7 until  $i < m$

step 5.5 :  $c[i] = A[i] \cap B[i]$

step 5.6 : print  $c[i]$

step 5.7: increment  $i$  by 1

step 6: If the user choose to perform set difference operation.

step 6.1: Read the cardinality of 2 sets.

step 6.2: check if  $m \neq n$  then print "operation not possible".

step 6.3 Else read the element in both sets.

step 6.4: Repeat the step 6.5 to 6.8 until  $i < n$

step 6.5 check if  $A[i] = 0$  then  $c[i] = 0$

step 6.6 else if  $B[i] = 1$  then  $c[i] = 0$

step 6.7: else  $c[i] = 1$

step 6.8: increment  $i$  by 1

step 7: Repeat the step 7.1 and 7.2 until  $i < m$

step 7.1: print  $[i]$

step 7.2: increment  $i$  by 1

## Binary Search Tree

step 1: start -

step 2: declare a structure and structure pointers for insertion deletion and search operations and also declare a function for inorder traversal.

step 3: declare a pointer as root and also the required variable.

step 4: Read the choice from the user to perform insertion deletion, searching and inorder traversal

step 5: If the user choice is to perform insertion operation then read the value which is to be inserted to the tree from the user.

step 5.1: Pass the value to the insert pointer and also the root pointers.

step 5.2: check if !root then allocate memory for root.

step 5.3: set the value to the info part of the root and then set left and right part of root to null and return root.

step 5.4: check if  $\text{root} \rightarrow \text{info} > x$  then call the insert pointer to left of root.

step 5.5: check if  $\text{root} \rightarrow \text{info} < x$  then call insert pointer to insert to the right of root.

step 5.6: Return the root.

step 6: If the user choose to perform deletion operation then read the element to be deleted from the tree pass the root pointer and item to the delete pointer.

step 6.1: check if not ptr then print node not found.

step 6.2: else if  $\text{ptr} \rightarrow \text{info} < x$  call the delete pointer by passing the right pointer and the item.

step 6.3: Else if  $\text{ptr} \rightarrow \text{info} > x$  then call delete pointer by passing the left pointer and the item.

step 6.4: check if  $\text{ptr} \rightarrow \text{info} == \text{item}$  then check if  $\text{ptr} \rightarrow \text{left} == \text{ptr} \rightarrow \text{right}$ , then free ptr and return null.

step 6.5: Else if  $\text{ptr} \rightarrow \text{left} == \text{null}$  then set  $\text{p1} = \text{ptr} \rightarrow \text{right}$  and free ptr, return p1.

step 6.6: Else if  $\text{ptr} \rightarrow \text{right} == \text{null}$  then set  $\text{p1} = \text{ptr} \rightarrow \text{left}$  and free ptr, return p1

step 6.7: Else set  $P1 = p1 \rightarrow \text{right}$  and  $P2 = p1 \rightarrow \text{right}$ .

step 6.8: while  $P1 \rightarrow \text{left}$  not equal to null, set

$P1 \rightarrow \text{left}$ .  $p1 \rightarrow \text{left}$  and free  $p1$ , return  $P2$ .

step 6.9: Return  $P1$ .

step 7: If the user choose to perform search operation  
then call the pointer to perform search operation.

step 7.1: Declare the necessary pointer and variables.

step 7.2: Read the elements to be searched.

step 7.3: while  $p1$  check if  $\text{item} > p1 \rightarrow \text{info}$  then  
 $p1 = p1 \rightarrow \text{right}$ .

step 7.4: Else if  $\text{item} < p1 \rightarrow \text{info}$  then  $p1 = p1 \rightarrow \text{left}$ .

step 7.5: Else break.

step 7.6: check if  $p1$  then print that element is found.

step 7.7: Else print element not found in tree and  
return root.

step 8: If the user choose to perform traversal, then  
call the traversal function and pass the  
root pointers.

step 8.1: If root not equal to null recursively call  
the functions by passing  $\text{root} \rightarrow \text{left}$ .

step 8.2: Print root  $\rightarrow$  info

step 8.3: call the traversal function recursively by  
passing root  $\rightarrow$  right
